EXPERIMENT 11

Deploying a Zoho Creator Application from Development to Production Environment

Patient Appointment Scheduling System

Tharun Krishna
241401118

1. Aim

To deploy the Patient Appointment Scheduling System built in Zoho Creator from the Development environment to the Stage environment for testing, and then to the Production environment, so that a tested and approved version of the application is live and available to end users.

The application manages patient profiles, department links, appointment records and department masters for a multi-specialty clinic, so changes must be reviewed and tested before they reach live users.

2. Procedure

Step 1: Review the application in Development — The dashboard of the Patient Appointment Scheduling System was checked: 5 patient department links, 5 appointment records, 5 department masters and 3 patient profiles (Section 3.2).

Step 2: Open the Environments page — Deploy > Environments was opened. The application showed the label *Changes available*, with version 1.0 in both the Stage and Production columns (Section 3.3).

Step 3: Select components for Stage — Publish > Publish to Stage was chosen. Seven form-field components of the Patient Profile form were selected and the Development and Staging code was compared side by side (Section 3.4).

Step 4: Enter the publish details — A title, description, version type (Minor) and email notification address were entered; the version change V1.0 to V1.1 was confirmed and the form was published (Section 3.5).

Step 5: Confirm the Stage deployment — The “Publish to Stage initiated” message and the completion email from Zoho Creator were checked (Section 3.6).

Step 6: Publish to Production — After testing in Stage, Publish to Production was started and the Environments page was used to track it (Section 3.7).

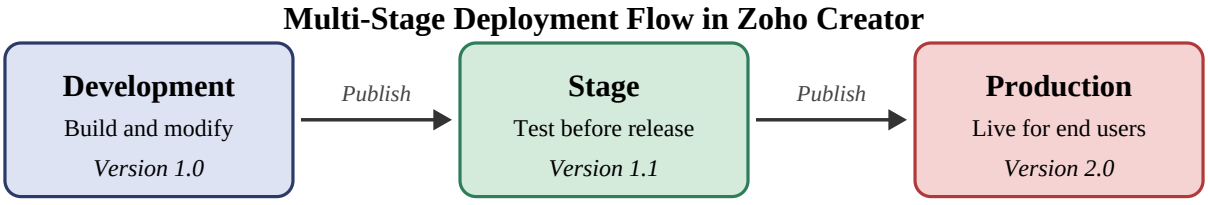

Step 7: Verify the live application — The Production environment, its version, its Live status and the Deployment Progress panel were verified (Section 3.7), and the results were summarised (Sections 3.8 and 3.9).

Note: *this record is based on screenshots captured during the deployment. Version numbers, dates and times are reported as shown on screen. Feature names and menu options depend on the Zoho Creator plan and version.*

3. Output

3.1 Multi-stage deployment model

Changes move one environment at a time; the application is in maintenance mode while publishing.

Zoho Creator provides three environments. Development is where the application is built, Stage is a testing copy, and Production is the live copy used by end users. A change is published to one environment at a time, so untested work never reaches live users.

3.2 Application overview (Development dashboard)

The dashboard showed 5 patient department links, 5 appointment records, 5 department masters and 3 patient profiles. It also gives the distribution of records by priority level (Low, Medium, Urgent), the review status (2 action required, 1 pending, 2 reviewed) and the records created by each user.

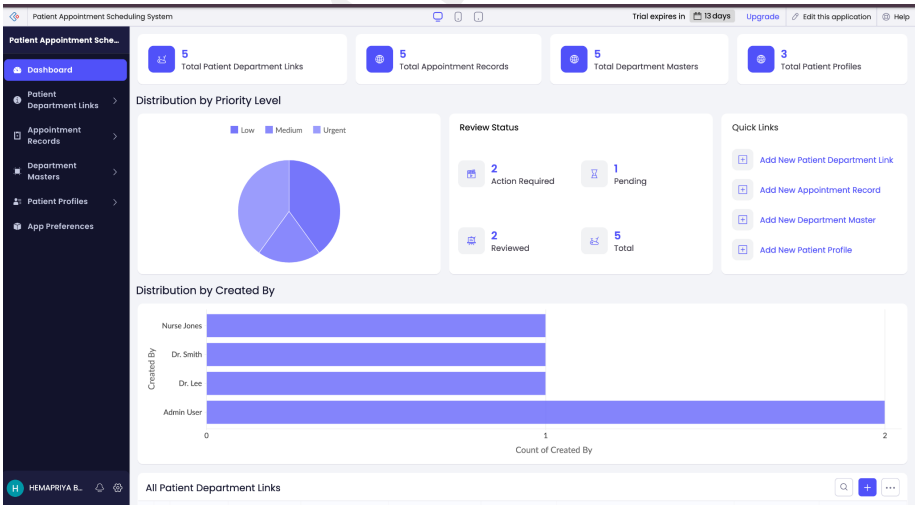

Figure 1: Application dashboard showing counts, priority distribution, review status and records by creator

3.3 Environments page

The Environments page lists the application with Stage and Production columns. Both initially held version 1.0 (Oct 06, 2026), and the label *Changes available* showed that Development had changes ready to publish.

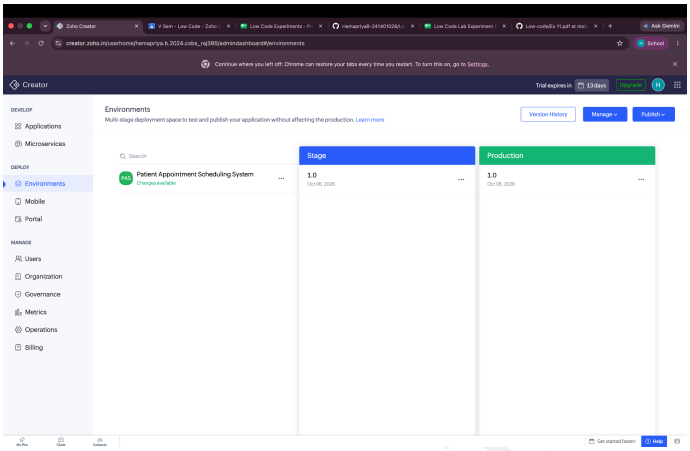

Figure 2: Environments page with Stage and Production columns (version 1.0)

3.4 Selecting components and comparing versions

In the Publish to Stage window, 7 components were selected from Forms > Patient Profile > Fields. The code view shows Development and Staging side by side for each modified component, here the Patient Name field.

The selected components were Preferred Appointment Time, Preferred Appointment Date and Consent For Treatment (Scheduling & Consent); Age and Patient Name (Patient Details); and Email Address and Contact Number (Contact Details).

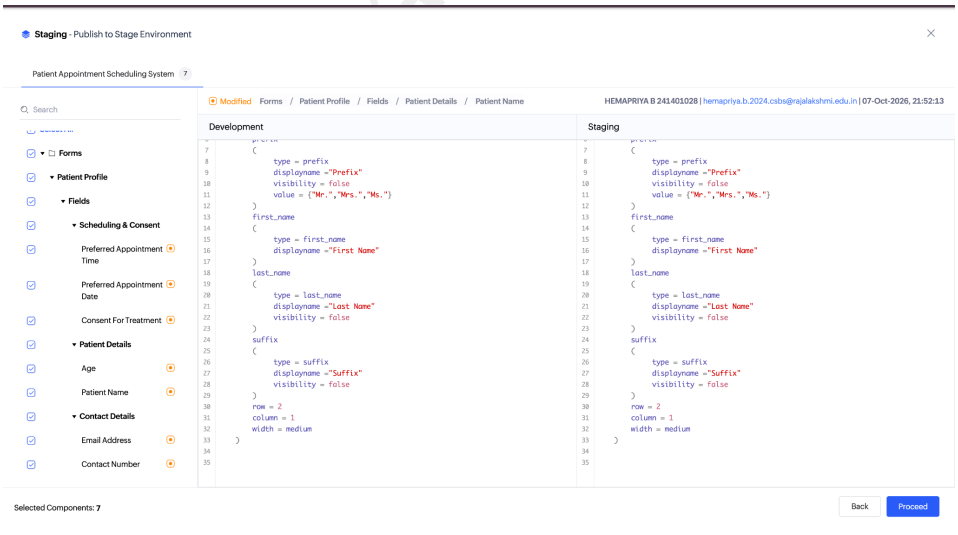

Figure 3: Component selection and Development vs Staging code comparison

3.5 Publish details

The title was entered as *Patient Appointment Scheduling System - Initial*, with the description “Initial deployment of the Patient Appointment Scheduling System from Development to Stage for testing.” The type was set to **Minor** (minimal changes and bug fixes), email notification was sent to the developer’s registered address, and the version changed from V1.0 to V1.1. A warning stated that the application will be in maintenance mode and inaccessible until

publishing is complete.

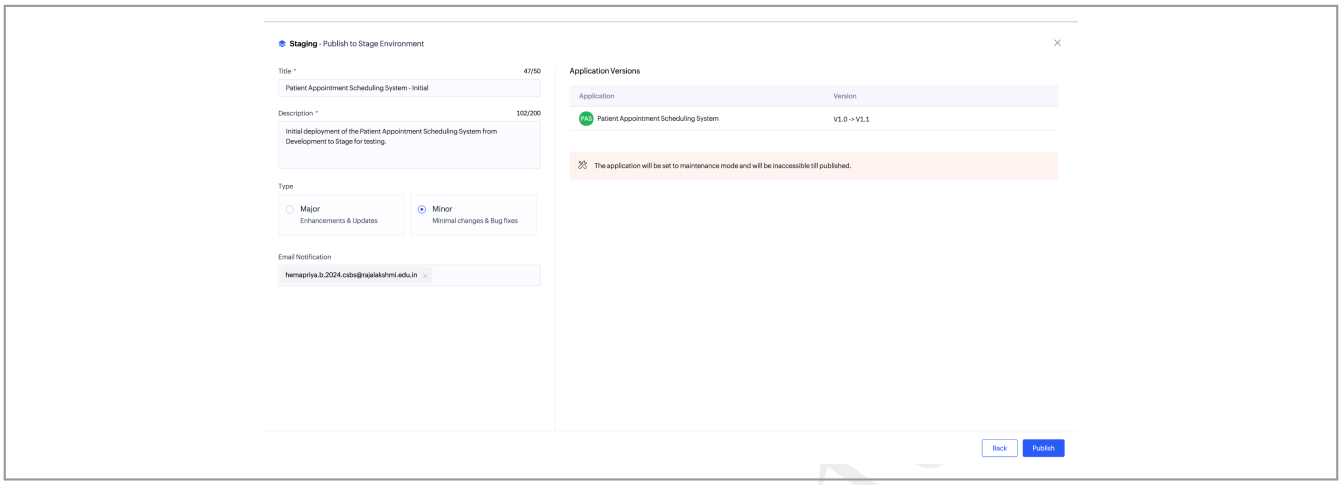

Figure 4: Publish to Stage form with title, description, type and version change

3.6 Stage deployment confirmation

After clicking Publish, Zoho Creator displayed “Publish to Stage initiated” and noted that the process takes a few minutes. A “Publish to Stage Completed” email from noreply@zohocreator.com confirmed that the version was published successfully with current version 1.1, initiated on 07 Oct 2026 at 22:03 IST.

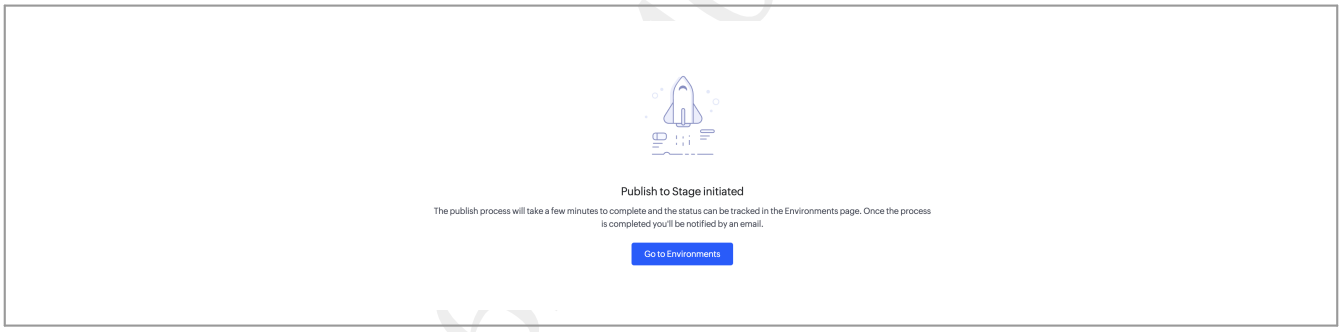

Figure 5: Publish to Stage initiated

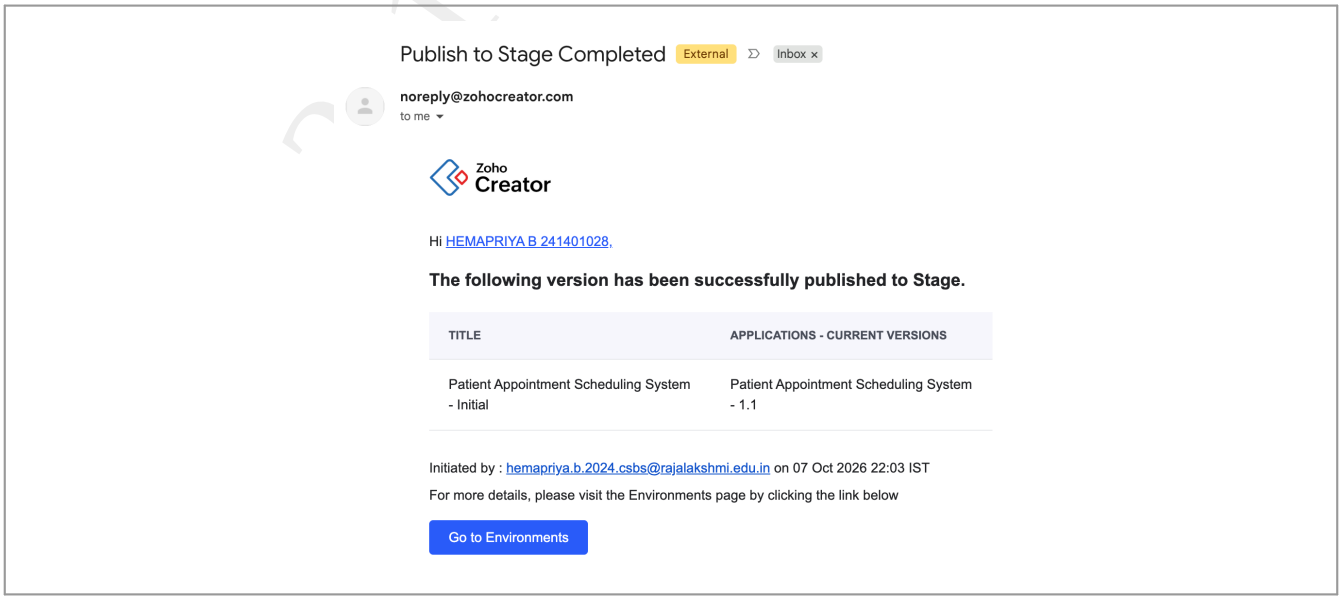

Figure 6: Completion email confirming the version published to Stage

3.7 Production deployment and live status

The tested version was then published to Production. The Environments page showed the Production environment at version 2.0 with status Live and the message “The application is published and live in Production.”

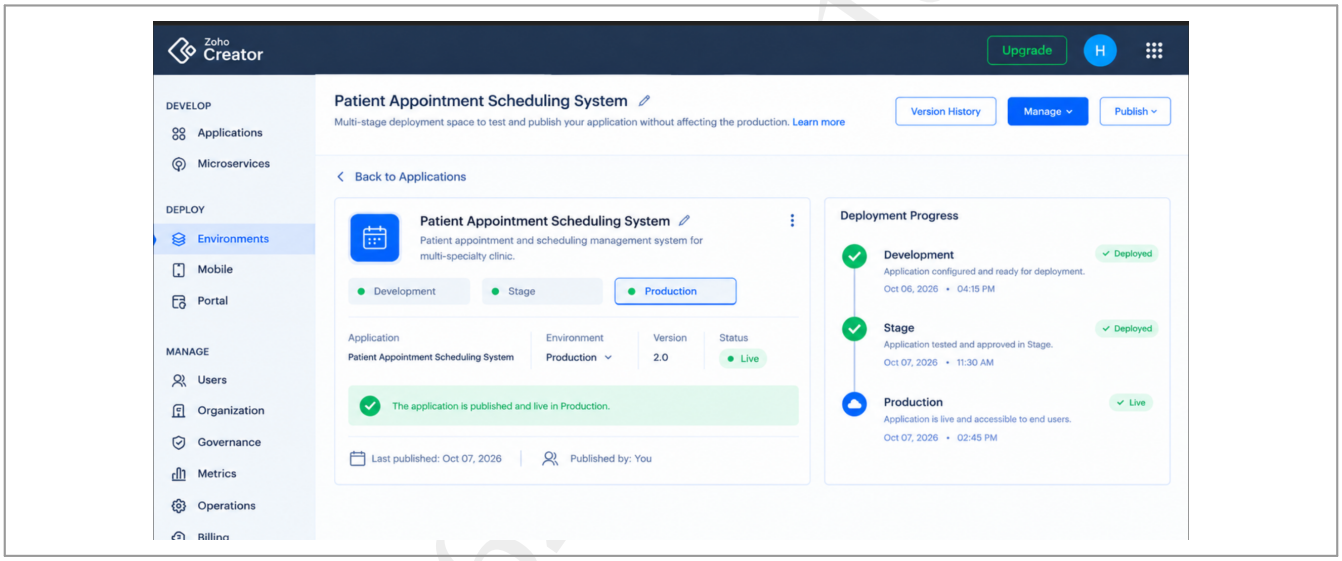

Figure 8: Production environment live, with Deployment Progress panel

3.8 Deployment summary

Environment	Version	Date	Status	Description
Development	1.0	Oct 06, 2026	Deployed	Application configured and ready for deployment
Stage	1.1	Oct 07, 2026	Deployed	Application tested and approved in Stage
Production	2.0	Oct 07, 2026	Live	Application live and accessible to end users

3.9 Deployment practices followed

The deployment followed good release practice: components were reviewed and the Development and Staging code compared before publishing; the version was tested in Stage before Production; each release carried a clear title, description and version type; email notification was enabled and received; the maintenance-mode warning was noted; and the Live status and Deployment Progress panel were checked after publishing.

4. Final Result

The Patient Appointment Scheduling System was deployed through the Zoho Creator multi-stage process. Seven Patient Profile form components were reviewed and published from Development to Stage as a Minor release (V1.0 to V1.1), confirmed by the Zoho Creator completion email. After testing, the application was published to Production, where the Environments page shows it as Live at version 2.0.

The exercise met its objective of deploying a Zoho Creator application from the Development environment to the Production environment using controlled, traceable steps.
