

Zoho Creator Admin Dashboard

Screen-by-Screen Documentation

This document walks through each major section of the Zoho Creator 'Creator' console admin dashboard. Every page includes the original screenshot followed by its Definition, Purpose, and Use Case.

241401118

1. Applications

Definition

The Applications page is the main landing screen of the Zoho Creator 'Creator' console. It lists every low-code application that has been built or created under the current user account, along with basic metadata such as the application name, icon, and creation date.

Purpose

Its purpose is to give the developer/administrator a central place to view, open, edit, or manage all their applications, and to create new applications using the 'Create Application' button.

Use Case

A developer logs in each morning to check which applications exist, opens the 'Low code' application to continue development, or clicks 'Create Application' to start building a new business app such as an inventory tracker or leave-management system.

2. Microservices

Definition

The Microservices page is a hub that lists the auxiliary services an application can use: AI Models, Connections, Datasources, and Custom APIs. Each section shows the services configured (or, as here, an empty state when none exist yet).

Purpose

It exists to let developers extend their low-code applications with external capabilities — connecting to third-party services, external databases, custom REST APIs, or AI/ML models — without building everything from scratch inside the app itself.

Use Case

A developer building a customer-support app might add a 'Connection' to a payment gateway, a 'Datasource' pointing to an external SQL database, or an 'AI Model' to auto-classify support tickets.

3. Environments

Definition

The Environments page provides a two-stage deployment pipeline — 'Stage' and 'Production' — where applications can be tested before being released live. Currently no applications have been added to either environment.

Purpose

The purpose is to separate testing from live usage so that changes can be validated in a safe 'Stage' environment before being 'Published' to 'Production', reducing the risk of breaking a live application.

Use Case

Before rolling out a new feature to end users, a developer adds the application to the Stage environment, tests the workflow, and only then promotes/publishes it to Production for real users to access.

Upgrade

T

Upgrade account to download your application as a rebranded mobile app

You can also download Zoho Creator branded app for free. Click here for [Android](#) or [iOS](#)

- Publish your apps in marketplaces like Playstore and Appstore.
- Distribute apps through MDM and direct installation link.
- Distribute apps by sending installation link through email.
- White-label your mobile application with your brand identity.

Upgrade

Definition

The Mobile section allows an application to be packaged as a rebranded, white-labelled mobile app for Android/iOS, or lets users download the generic Zoho Creator branded app. On the current (free) plan, rebranding requires an account upgrade.

Purpose

Its purpose is to extend web applications to mobile devices, giving end users native app access, and to allow organizations to publish their own branded app to the Play Store / App Store instead of using the generic Zoho Creator app.

Use Case

A company wants field staff to fill out inspection forms from their phones under the company's own brand name and logo rather than 'Zoho Creator' — they would upgrade and use this Mobile section to distribute a rebranded app.

5. Portal

Definition

The Portal section lets an organization create a dedicated, branded login/sign-up space for external users (customers, vendors, etc.) separate from internal employee users. This feature is locked behind an account upgrade on the free plan.

Purpose

The purpose is to give external stakeholders controlled, self-service access to specific applications through a custom-branded portal, hosted optionally on the organization's own domain.

Use Case

A business wants its customers to log in through 'portal.company.com' to raise support tickets or track orders, without giving them full internal-user access — this is set up via the Portal feature.

Here is your Smart Chat (Ctrl+Space) Help

Definition

The Users page lists every individual who has been granted access to the organization's applications, showing their name, role (e.g. Super Admin), email address, and account status (Active/Inactive).

Purpose

It exists to manage role-based access control — adding, removing, or reviewing who can log in and what privileges they hold within the organization's Zoho Creator account.

Use Case

An administrator needs to onboard a new team member as an editor on an application; they come to the Users page, click 'Add User', and assign the appropriate role.

7. Organization

The screenshot shows the 'Organization' settings page in the 'Creator' dashboard. The left sidebar contains navigation links under three categories: DEVELOP (Applications, Microservices), DEPLOY (Environments, Mobile, Portal), and MANAGE (Users, Organization, Governance, Metrics, Operations, Billing). The 'Organization' link is highlighted. The main content area is titled 'Organization' with a subtitle 'Setup your company's profile, preferences, and branding information. [Learn more](#)'. It contains three main sections: 1. 'Organization Logo' and 'Favicon', each with a placeholder image and an 'Upload' button. 2. 'Contact Information', which includes 'Org. Name' (tharunkrishnashanmugasund), 'Address' (with an 'Edit' link), 'Super admin Details' (Email: tharunkrishnashanmugasundar.2024.csbs@rajalakshmi.edu.in, Phone: 91-9962380422), and 'Preferences' (Organization namespace: tharunkrishnashanmugasund, Time Zone: (GMT +05:30) Asia/Kolkata). 3. 'Delete Account', which states 'Permanently delete all the apps and data associated with your account under this organization. [Learn More](#)' and includes a 'Delete Account' button. The footer shows a chat prompt 'Here is your Smart Chat (Ctrl+Space)' and a 'Help' link.

Definition

The Organization page holds the company/account profile: logo, favicon, organization name, address, super-admin contact details, namespace, and time zone preferences. It also contains the option to permanently delete the account.

Purpose

Its purpose is to centralize organization-wide branding and configuration settings that apply across every application built under the account.

Use Case

Before going live, an admin uploads the company logo and favicon here so that all applications and portals carry consistent branding, and verifies the correct time zone is set for accurate timestamps.

8. Governance

Definition

The Governance page consolidates organization security controls, including Security Policies, Custom Authentication, Active Directory integration, and Domain settings.

Purpose

The purpose is to let administrators enforce consistent security standards — such as password rules and multi-factor authentication — across the whole organization from a single place.

Use Case

An IT administrator wants to mandate multi-factor authentication for all users; they open Governance → Security Policies → 'Configure Security Policy' to enable and enforce it.

9. Metrics

Definition

The Metrics page provides analytics on application activity, user activity, and portal user activity, filterable by a time period (e.g. 'Today'). No activity is shown yet since the account is new.

Purpose

Its purpose is to give administrators visibility into how applications and users are being used, helping to spot trends, usage spikes, or anomalies.

Use Case

A manager wants to know how many users accessed a particular application this week and which features were most used — they would review the 'User activity' and 'Application activity' tabs here.

10. Operations

Definition

The Operations page is a centralized management console linking to backend administrative tools: Backup, Audit Trail, Email Management, Domain Restriction, API Management, Blueprint Analytics, Logs, Publish, Form Email, Marketplace, Support Access, System Integrations, Zia, Payment Gateways, and Databridge.

Purpose

The purpose is to give administrators a single hub for operational and maintenance tasks — data backup, monitoring, integrations, and compliance — that keep the account running smoothly and securely.

Use Case

An administrator wants to schedule a periodic backup of all application data, or check the 'Audit Trail' to see who made a recent change — both are accessed through the Operations page.

11. Billing

Definition

The Billing page shows the account's active subscription plan (currently the 'Free Plan'), plan limits (e.g. Users 1 of 1, Apps 1 of 1), and a link to detailed usage insights, along with an option to upgrade.

Purpose

Its purpose is to let administrators track subscription usage against plan limits and upgrade the plan when more users, applications, or features are needed.

Use Case

When a team outgrows the free plan's single-user, single-app limit, the admin visits Billing, reviews the current usage, and clicks 'Upgrade Now' to move to a paid plan that supports more users and applications.
